

Keyboard PLUGIN GUIDE

Built on the popular Swarachakra keyboard, this plugin allows you to enter text on one phone from any other connected device. Once connected, the controlling device can manipulate the keyboard in any other app, making it useful in many situations.

Currently supporting both Marathi and English, the Better Together keyboard plugin can be used to aid learning – for example, to help children with spelling or grammar. It can also be beneficial for those who do not speak a language (or have little to no written literacy) to get help entering text. Other benefits of the keyboard include being able to enter text remotely using a personal device, and providing the ability for multiple people to edit the same document at the same time using independent devices with no internet connection required.

First, choose whether to type on another phone from this phone, or to type on this phone from another phone.

Next, scan the QR code on the host phone with the scanner on the controller phone.

CONTROLLER DEVICE

HOST DEVICE

Now use the Swarachakra keyboard on the controller device to change or add text on the host device. Once connected, the controller device will continue to control the keyboard of the host even if the current app changes.

The current version of the plugin supports both Marathi and English language keyboards.
