# Shopping
PLUGIN GUIDE

This plugin demonstrates how the components of a shopping website could be separated, allowing different devices to display either a single item for purchase, a category, or the shopping basket.

Users interact with the system by touching the screen or gesturing with any of the devices.

This functionality allows users to see products and categories laid out across multiple devices, and can be useful to allow multiple people to shop together.

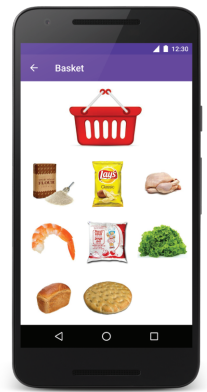

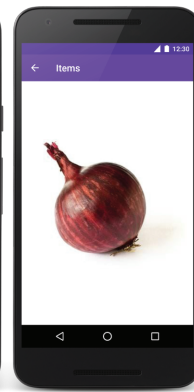

Once connected, each device can represent either a category, items that can be purchased, or the shared shopping basket.
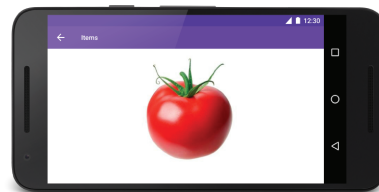

Product categories, such as vegetables, dairy or fish. Touch a category to change to this group on all item devices (see right).

Items in a category are displayed separately on individual devices. Add to the shopping list by touching an item, and then tapping the basket.

The shared shopping basket. To remove an item, touch first on the basket, and then on the item to be removed.

Physically flip a phone to change a product or category

This plugin is part of the:

better together

toolkit
